TECHNICAL SECRETARY - R. MORRIS

On Tuesday 5th April 2016 the DairyMeade NZ breed society was formed.

Origins - The DairyMeade NZ breed had its origins in 1996 through the use of East Friesian semen to produce progeny from Coopworth and limited numbers of Border Leicester ewes, all carefully selected to be of appropriate size and body conformation to be used for machine milking.

Definition of DairyMeade NZ - animals must be able to have their pedigree traceable to the Kingsmeade flock, or to another registered flock of a society member, or must have evidence acceptable to the Breed Committee that the genetic history of the flock is compatible with the objectives of the Society.

The breed has agreed on the following –

That the breed has Appendix flocks. At the $\frac{3}{4}$ stage ewes are eligible to enter the purebred flock and the resulting progeny are purebred. Rams require a further cross to be used in a Purebred flock and Appendix flock.

That $\frac{3}{4}$ ewes entering purebred flocks must be inspected by a Council Appointee.
